Internetworking with routers in cisco packet tracer simulator

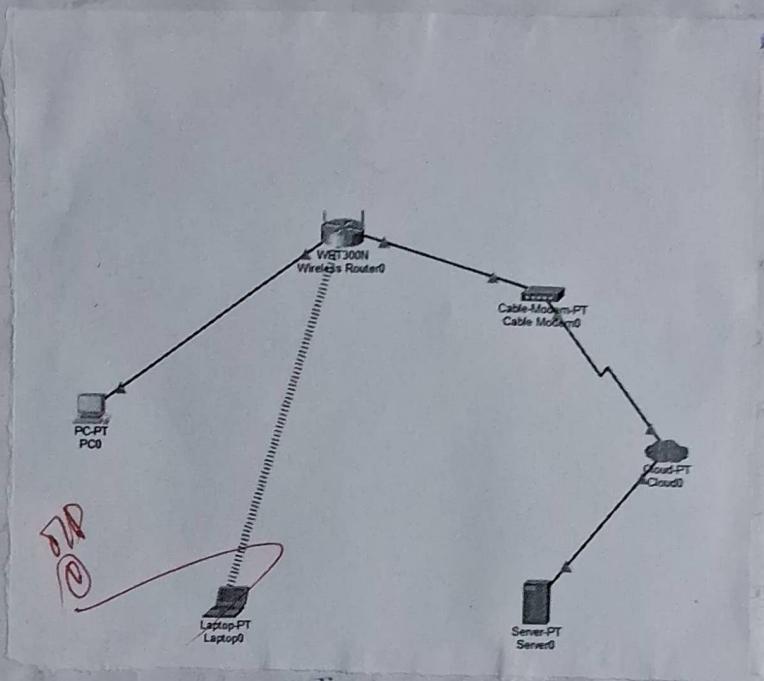

Aim:

To design and configure an internetwork using router in cisco packet tracer, connect different network, assign IP address and observe packet transmission

Procedure:

* open cisco packet tracer and create the required network network topology.
* create different networks with 3-4 hosts in each network.
* connect the different networks using a router
* connect the hosts in each network using the required network devices
* assign suitable static IP addresses and subnet masks to all the machines
* Configure the appropriate default gateway for each host
* assign suitable IP address to the router interfaces connected to the different networks
* activate and verify the required router interfaces
* check the IP configuration and connectivity of all the connected devices.
* Perform packet transmission between hosts belonging to different networks

Result :

Thus, an internetwork was successfully designed and configured using routers in cisco packet tracer. different network were connected using routers static IP address were assigned, packet routing was observered and internetworking using wireless router, DHCP, internet cloud switch and ethernet cables was successfully verified
